

1695 frames; 549 dropped where the two label orders disagreed; edges significant on EITHER test: over-represented against a marginal-preserving shuffle (solid head) or one-way against its own transpose (open head); same-kind edges headless and testable only by the shuffle. 'mixed' is the coder's ABSTENTION -- no one kind covers two thirds of that group's words -- not a kind; FUNCTION omitted; every arrow is labelled with one word pair from a frame that took it and every count is on a node. Column three is the 237 frames the coder found a feeling in: 779 more had none on either side and are not drawn. Onward arrows are each edge's largest fate plus any over-represented one, 58 frames in smaller flows omitted
